

Frontend And Chat Service Integration

1. Subscribe To The Stream

```
GET /v1/chat/{conversation_id}/stream
Accept: text/event-stream
```

Sample request

```
GET http://localhost:7080/v1/chat/1234-1234-1234-1234/stream
```

Example event

```
event: bot.ask
data: {
  "prompt": "Vui long chon khoa ma ban muon toi.",
  "slot": "department_id",
  "state": "state.issue_ticket.gather.askslot.department_id",
  "required": true
}
```

Field	Meaning
prompt	Message shown to the end user.
state	Normalised state hint that the frontend can map to a specific screen.
slot	Logical key that explains which data the bot is asking for.
required	When <code>true</code> , the step must be completed before moving on.

Other common events:

- `message.completed` : echo of the user turn.
- `bot.summary` : snapshot of filled slots before confirmation.
- `bot.ticket` , `bot.route` , ...: business results generated by the FSM.
- `state.updated` : raw FSM state name (for diagnostics or analytics).

Issue ticket flow

- `state.issue_ticket.gather.askslot.service_type` – ask for the visit type (BHYT, dich vu, ...).
- `state.issue_ticket.gather.askslot.department_id` – ask for the target department.
- `state.issue_ticket.confirm` – waiting for user confirmation after the slot summary.
- `state.issue_ticket.done` – ticket was created (no user action required).

2. Send A Message

```
POST /v1/chat/{conversation_id}
Content-Type: application/json
X-Tenant-Id: <tenant-id>
Idempotency-Key: <uuid-per-turn>
```

Sample request

```
POST http://localhost:7080/v1/chat/1234-1234-1234-1234
Content-Type: application/json
X-Tenant-Id: tenant-demo
Idempotency-Key: 550e8400-e29b-41d4-a716-446655440000
```

```
{
  "role": "user",
  "content": "Toi muon lay so thu tu kham benh",
  "attachments": [],
  "stream": true,
  "options": {}
}
```

Sample response (HTTP 202)

```
{
  "conversation_id": "1234-1234-1234-1234",
  "session_id": "db3d4542-8b44-4b7a-9e33-083d739ce5ed",
  "message_id": "da85b8c0-3cc9-4a4d-9712-a0b3fe6ad0e2",
  "stream_url": "/v1/chat/1234-1234-1234-1234/stream"
}
```

Always generate a unique `Idempotency-Key` per turn to make retries safe.
